Excerpt from Natural Laws in Piano Teaching It has been argued that it not only is unnecessary but inadvisable to make a study of the anatomy of the hand, of the muscles used in piano playing, and their various actions; that the mind should be upon the effect to be produced, upon tone production and interpretation and not upon mechanical actions. It is, however, the experience of the author that every pupil can be most easily reached by knowing the reasons for everything. By teaching cause and effect, the pupil learns to deduce his own rules or laws. He works more intelligently and therefore more directly, with least possible loss of time. Also when an appeal is made to the reason, he is more interested to obtain accurate results by realizing the necessity of observing unchanging governing laws. When the impression is thus deeply made, it is most easily retained by the memory. In the first stages of technical development, when position, condition, and actions are being established, there is no opportunity for interpretation. A student cannot learn to paint until he learns how to mix his colors. One thing must be studied at a time. The first step in the beginning of technical study must be to obtain conscious control and development of the hand. If correct and intelligent methods are used from the first, there will be no mechanical or muscular distraction when the subject of interpretation is reached. A powerful, neuroscience-based approach to revolutionize early childhood learning through natural creativity, strong human connections, spontaneous free play, and more. All children are born wired to learn and to love. As young children explore the world and interact with others, their brains can naturally develop in incredible ways. And yet, despite our best intentions, early education often fails to fully encourage this natural learning and empathy. The Natural Laws of Children draws on current research in childhood development to share powerful insights on how to enhance learning for all kids, regardless of income or access to resources. This book tells the story of Céline Alvarez ' s pioneering work in early childhood education. Over three years in a low-income school, Alvarez ' s students achieved exceptional results in math and reading, as well as outstanding social and emotional skills. The Natural Laws of Children shares, in a clear and accessible way, the main scientific principles that underpin human learning to revolutionize early childhood education by supporting strong human connections, spontaneous free play, and more.
